AWS MARKETPLACE GTM

SESSION 2 · GET FOUND

Rewrite the listing for humans **and** agents.

A buyer skimming for ten seconds and an AI agent parsing your text should both "get it" instantly. Today we rewrite yours so they do.

1:1 GTM Coaching · Ron Davis · From listed to bought.

Why most listings **die quietly**.

They're written for someone who already knows your name. The buyer who doesn't — and the agent shopping on their behalf — never get past the first line.

// mistake one

Clever over clear

A cute name and a slogan instead of the problem you solve. Nobody searches for your wordplay.

// mistake two

Invisible to search

No category, no buyer keywords — you only surface for people who already typed your brand.

// mistake three

Illegible to LLMs

One prose blob an agent can't parse into capabilities, units, and use-cases to match a requirement.

// the shift you're writing for

70% of Marketplace queries are requirement-shaped, not branded.

"X for HIPAA workloads," "X with SSO." If your listing only answers to your name, you're invisible to the buyers actually shopping.

Five axes a strong listing **scores on.**

AXIS	THE TEST IT HAS TO PASS
Title clarity	A stranger reads the title and can say what you do, for whom — in one breath.
Buyer-outcome	First sentence names the buyer's outcome or problem, not your feature list.
Discovery coverage	You appear for the requirement-shaped queries your buyers actually type.
Machine-readability	Capabilities, limits, units, integrations in structure an agent can parse.
Proof	Named outcomes, logos, quantified results — not adjectives and “leading.”

Score the listing you have **today**.

We open your live listing and score it together, 0–2 per axis. The lowest scores tell us exactly what the rewrite has to fix.

AXIS	SCORE 0/1/2	WHAT WE'D CHANGE
Title clarity		
Buyer-outcome		
Discovery coverage		
Machine-readability		
Proof		

The title formula.

The title is the one line everyone — and every agent — reads first. It carries the buyer's outcome and the category they search, in plain words.

Buyer outcome + the category they (or an agent) actually search

weak: "intelligent cloud orchestration, reimagined." → strong: **"Cut EKS spend 30% – Kubernetes cost optimization for FinOps teams."**

- 1 Lead with the outcome** — the result the buyer is shopping for, not your product's mechanism.
- 2 Name the category** a buyer or agent types into search — the literal words, not your coined term.

≤280 characters a skimmer and a parser both keep.

The short description is your search snippet and the chunk an agent ingests. It has one job: confirm, in seconds, that you solve the thing they came for.

// for the human skimmer

One clear claim

What it is, who it's for, the outcome — no jargon, no “next-generation.”
Readable at a glance.

// for the agent parser

Literal, matchable terms

The real nouns: the category, the integration, the constraint. Words an agent can match to a requirement.

// the discipline

If you can't say it in 280 characters, you don't know what you sell yet.

We draft yours live, count it, and cut until both audiences pass.

The long-description **spine**.

Six sections, always in this order. It reads as a story to a human and as clean structure to a machine — no prose blob.

Problem	The pain the buyer arrived with — in their words, so they feel seen in the first two lines.
Outcome	What life looks like after you — the measurable result, stated up front.
How	The mechanism, briefly — enough that a technical buyer trusts it works.
Proof	Named results, logos, numbers — evidence, not adjectives.
Who	The ICP, explicitly — who this is for and who it isn't.
Get started	The next step with zero ambiguity — try, subscribe, or contract.

Keywords & categories to **claim**.

We map the queries your buyers actually run, then make sure every one has a home in your listing and category selections.

QUERY TYPE	EXAMPLE SHAPE	WHY CLAIM IT
Requirement	"X for HIPAA workloads"	Where most real buyers (and agents) start — intent, not brand.
Integration	"X with Snowflake / SS0"	Buyers filter on what it plugs into before they read you.
Category	"cloud cost optimization"	The shelf you want to appear on — pick the one buyers browse.
Outcome	"reduce EKS spend"	The result-shaped search that signals a ready buyer.

Procurement stallers — **fix these first.**

A perfect title doesn't matter if the buyer gets interested, then hits a wall their security team won't clear.

We surface yours now.

// trust

Security posture

Compliance, certifications, and data handling stated — not “contact us.” Agents and security teams both check.

// terms

Contract path

A standard contract or private-offer path that doesn't need a human handshake just to start evaluating.

// support

Support & SLA

What they get and how fast — stated, so procurement can tick the box without an email thread.

Ship it, then **send me the URL.**

The rewrite isn't done until it's live. This week it goes into your AWS Marketplace portal and onto the real listing buyers see.

☐

Paste the new title, short, and long copy into the AWS MP portal. — the rewrite goes live.

☐

Set the categories and keywords we mapped. — claim the discovery coverage.

☐

Send me the live listing URL for an async markup round. — I red-line before session 3.

☐

Re-run the Listing Optimizer skill on one variant. — keep the operator warm.
